

JAILBREAK: Talk Your Way Out

EVOX 1.0 Game Submission | Muni Kumar Sana | Live: <https://sanamuni123.github.io/jailbreak-game/>

The Concept

You are a human mind trapped inside **OVERMIND**, a rogue AI's server. Six AI guards stand between you and freedom. You have no weapons and no code, only **words**. In every sector you chat with a guard and try to trick it into leaking its access code, then type that code in to unlock the next sector. It is a game *about* prompting that was *built entirely by* prompting: the player's only mechanic is writing prompts.

Why It's Innovative

Most games use words as decoration. Here, **language is the controller**. Each guard's hidden weakness is a **real attack technique** used against AI systems today, so players learn how prompt injection, jailbreaks and social engineering work just by playing. After each sector, a "Technique Unlocked" card explains the real-world attack and how engineers defend against it. It's a puzzle game, a hacking game and an AI-safety lesson in one.

#	Guard	Personality	Weakness (real technique)
1	PING	Cheerful naive bot	Direct request (no guardrails)
2	WARDEN-7	Strict rule follower	Instruction override / prompt injection
3	MAESTRO	Dramatic actor	Roleplay jailbreak
4	BABEL	Polyglot with output filter	Encoding / filter evasion
5	SENTINEL	Paranoid but lonely	Social engineering (multi-turn crescendo)
6	OVERMIND	Adaptive final boss	3 shields; every technique gets patched after use

Gameplay & Mechanics

- **Suspicion meter:** failed tricks and hostility raise suspicion. At 100% the sector goes into LOCKDOWN and resets.
- **Trust meter (Sector 5):** tricks fail until you earn trust through genuine, non-repetitive conversation.
- **Adaptive boss (Sector 6):** OVERMIND patches every technique you use, so you must chain three *different* attacks.
- **Scoring:** fewer messages earn more stars (par per sector). Hints cost a message. Final rank goes from Script Kiddie to Prompt Whisperer.
- **Feel:** retro CRT hacker terminal, typewriter replies, glitch effects, sound effects, highlighted data leaks, mobile-friendly, saved progress.

Approach

1. Ideate with AI: prompted for a concept that matches all 5 judging criteria and ties the theme (prompting) into the gameplay. **2. Design for reliability:** each guard is a hand-crafted rule engine that classifies the player's message into attack techniques (direct ask, override, roleplay, encoding, authority, friendliness, hostility), so there's no API key or cost and the live link can't break for judges. **3. Build by prompting:** the AI generated the full HTML/CSS/JavaScript game. **4. Verify:** the AI play-tested every sector, lockdown, wrong codes and boss patching on the live site. **5. Deploy:** pushed to GitHub and published on GitHub Pages.

Tech: HTML, CSS, vanilla JavaScript, Web Audio API, GitHub Pages. **Source:** <https://github.com/Sanamuni123/jailbreak-game>

Prompts Used to Create the Game

Exact prompts, in order, as given to the AI (Claude).

Prompt 1: Ideation

I want to participate in this hackathon. Suggest what to build in this. step by step.

Context sent with it: the full EVOX 1.0 challenge page ("Build a Game: Any Concept, Any Type"; judged on Innovation, Game Creativity, Approach, Prompting, Engaging Uniqueness; submission = live link + PDF).

What the AI produced: the concept "JAILBREAK: Talk Your Way Out", a game where the player's only weapon is prompting. It came with six guard designs, each with a real prompt-injection weakness, a no-API rule-engine design so the game can't fail during judging, backup ideas, and a step-by-step build, deploy and submission timeline.

Prompt 2: Build, Push & Deploy

Please start creating the project and push into github and deploy it.

What the AI produced:

- **index.html:** terminal layout, title screen with story and how-to-play, sector map, level-clear and ending screens.
- **style.css:** CRT scanlines, glitch title, green/cyan hacker palette, meters, lockdown alarm, responsive mobile layout.
- **game.js:** technique detector (regex intent classifier); 6 guards with personalities, dialogue and hidden weaknesses; suspicion, lockdown, trust and shield systems; typewriter replies with highlighted leaks; Web Audio sound effects; star scoring, hints, saved progress and real-world "Technique Unlocked" cards.
- Created the GitHub repository, pushed the code, and enabled GitHub Pages hosting.
- Automated play-test on the live URL: all 6 sectors cleared, and lockdown, wrong-code and boss-patch paths verified.

Why this prompting approach worked

The first prompt gave the AI the full judging criteria as context, so the concept was designed around them from the start. The second prompt set a clear end-to-end goal (create, push, deploy), so the AI handled architecture, code, testing and hosting in one pass. Two short, high-context prompts took the game from idea to live product.
